Janus International Introduces New Motor Operated Fire Door and New Fire Shutter

FOR IMMEDIATE RELEASE

(Temple, GA – November 5, 2010) Janus International has released an exciting new motor operated fire door system that allows dealers to buy very competitive fire protection with proven floor level testing and optional awning crank over-ride for emergency operation during power loss. Rated for up to four hours of protection on masonry or sheetrock walls, it also features the UL S label for smoke and draft protection. “The Model FD30MC fire door uses a ½ HP motor rated for 10 cycles per hour with standard gearhead reduction to reliably operate fire doors in openings up to 150 square feet in area,” states David Dawdy, commercial products manager. “The limits are driven during drop testing and require no resetting, and there is no tension loss during activation. These features, coupled with a simple onboard mechanical disconnect, allow foolproof drop testing and resetting from any position within a matter of seconds.” The Model FD30MC is supplied with three fusible links and may be activated by heat or by a failsafe release device. It is UL325 compliant and may be purchased with a wide variety of optional fire protection equipment.

(Temple, GA – November 12, 2010) Janus International has received UL approval for their new counter fire shutter line, which includes manual pushup, awning crank, chain hoist and motor-operated models in painted steel and stainless steel selections. Labeled for up to three hours of protection, the FS40 Series fire shutter features simple installation and drop testing designs that any installer will appreciate, including a new and proprietary selectable governor system unique to Janus fire protection products. “There will be more to unveil with this line of shutters, including integral frame construction, S label availability and simple test ability,” says David Dawdy, commercial products manager. “We are well underway with additional innovations and approvals that will enhance this line further and help bring it to the front edge of product development.”
