

Why Upgrade Your Building with Rolling Steel Doors

STRUCTURAL INTEGRITY

Rolling steel doors are designed with interlocking steel slats that increase the strength and durability of the door's curtain.

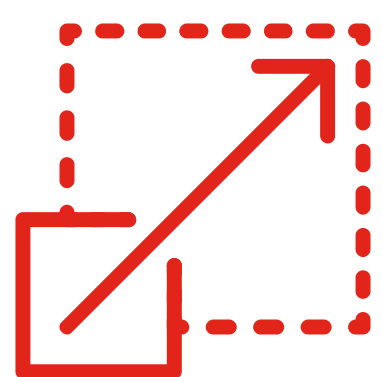

THERMAL EFFICIENCY

Having a front and a back slat allows rolling steel doors to be filled with polyurethane or polystyrene insulation.

CUSTOMIZATION

Rolling steel doors can be powder coated in virtually any color to meet exact design needs while maintaining a more durable top coat.

SPACE SAVINGS

Unlike doors that slide on the wall or ceiling, rolling steel doors coil up into a roll above the doors opening, maximizing interior space.

SECURITY

The slatted design of a rolling steel door is a stronger, more durable curtain, contributing to many advantages such as higher security and better wind load ratings.
